PROTOTYPE I
A REPAIR-AND-RECOVERY GAME ABOUT RESOURCE WASTE
PYTHON AND PYGAME, PC

GAME DESCRIPTION

- SINGLE-PLAYER RESOURCE MANAGEMENT
- UNDERGROUND SILO SURVIVAL
- TOXIC SURFACE, SCARCE RESOURCES

- REPAIR · REUSE · RECOVER · INCINERATE
- MENTORED BY MARTHA
- BEFORE TIMES RELICS

IMPLEMENTED MECHANICS (LEVELS 1 TO 3)

Progression: Each level needs 100 points, and a score that falls too low sends you back a level.

Level 1, Sorting: Objects arrive on a conveyor belt. You inspect each one and choose Reuse, Repair, Recover or Incinerate. The score is +10 for a correct choice and -5 for a wrong one.

Level 2, Material Recovery: You take apart the objects you sent to Recover, pick the usable parts and store them. Each usable part is +10 and each damaged part picked is -5.

Level 3, Learning to Repair: Martha explains each repair step by step, and you pick the matching action from six options. A correct action is +5 and a wrong one is -5. A finished repair is +15.

WORKING FEATURES

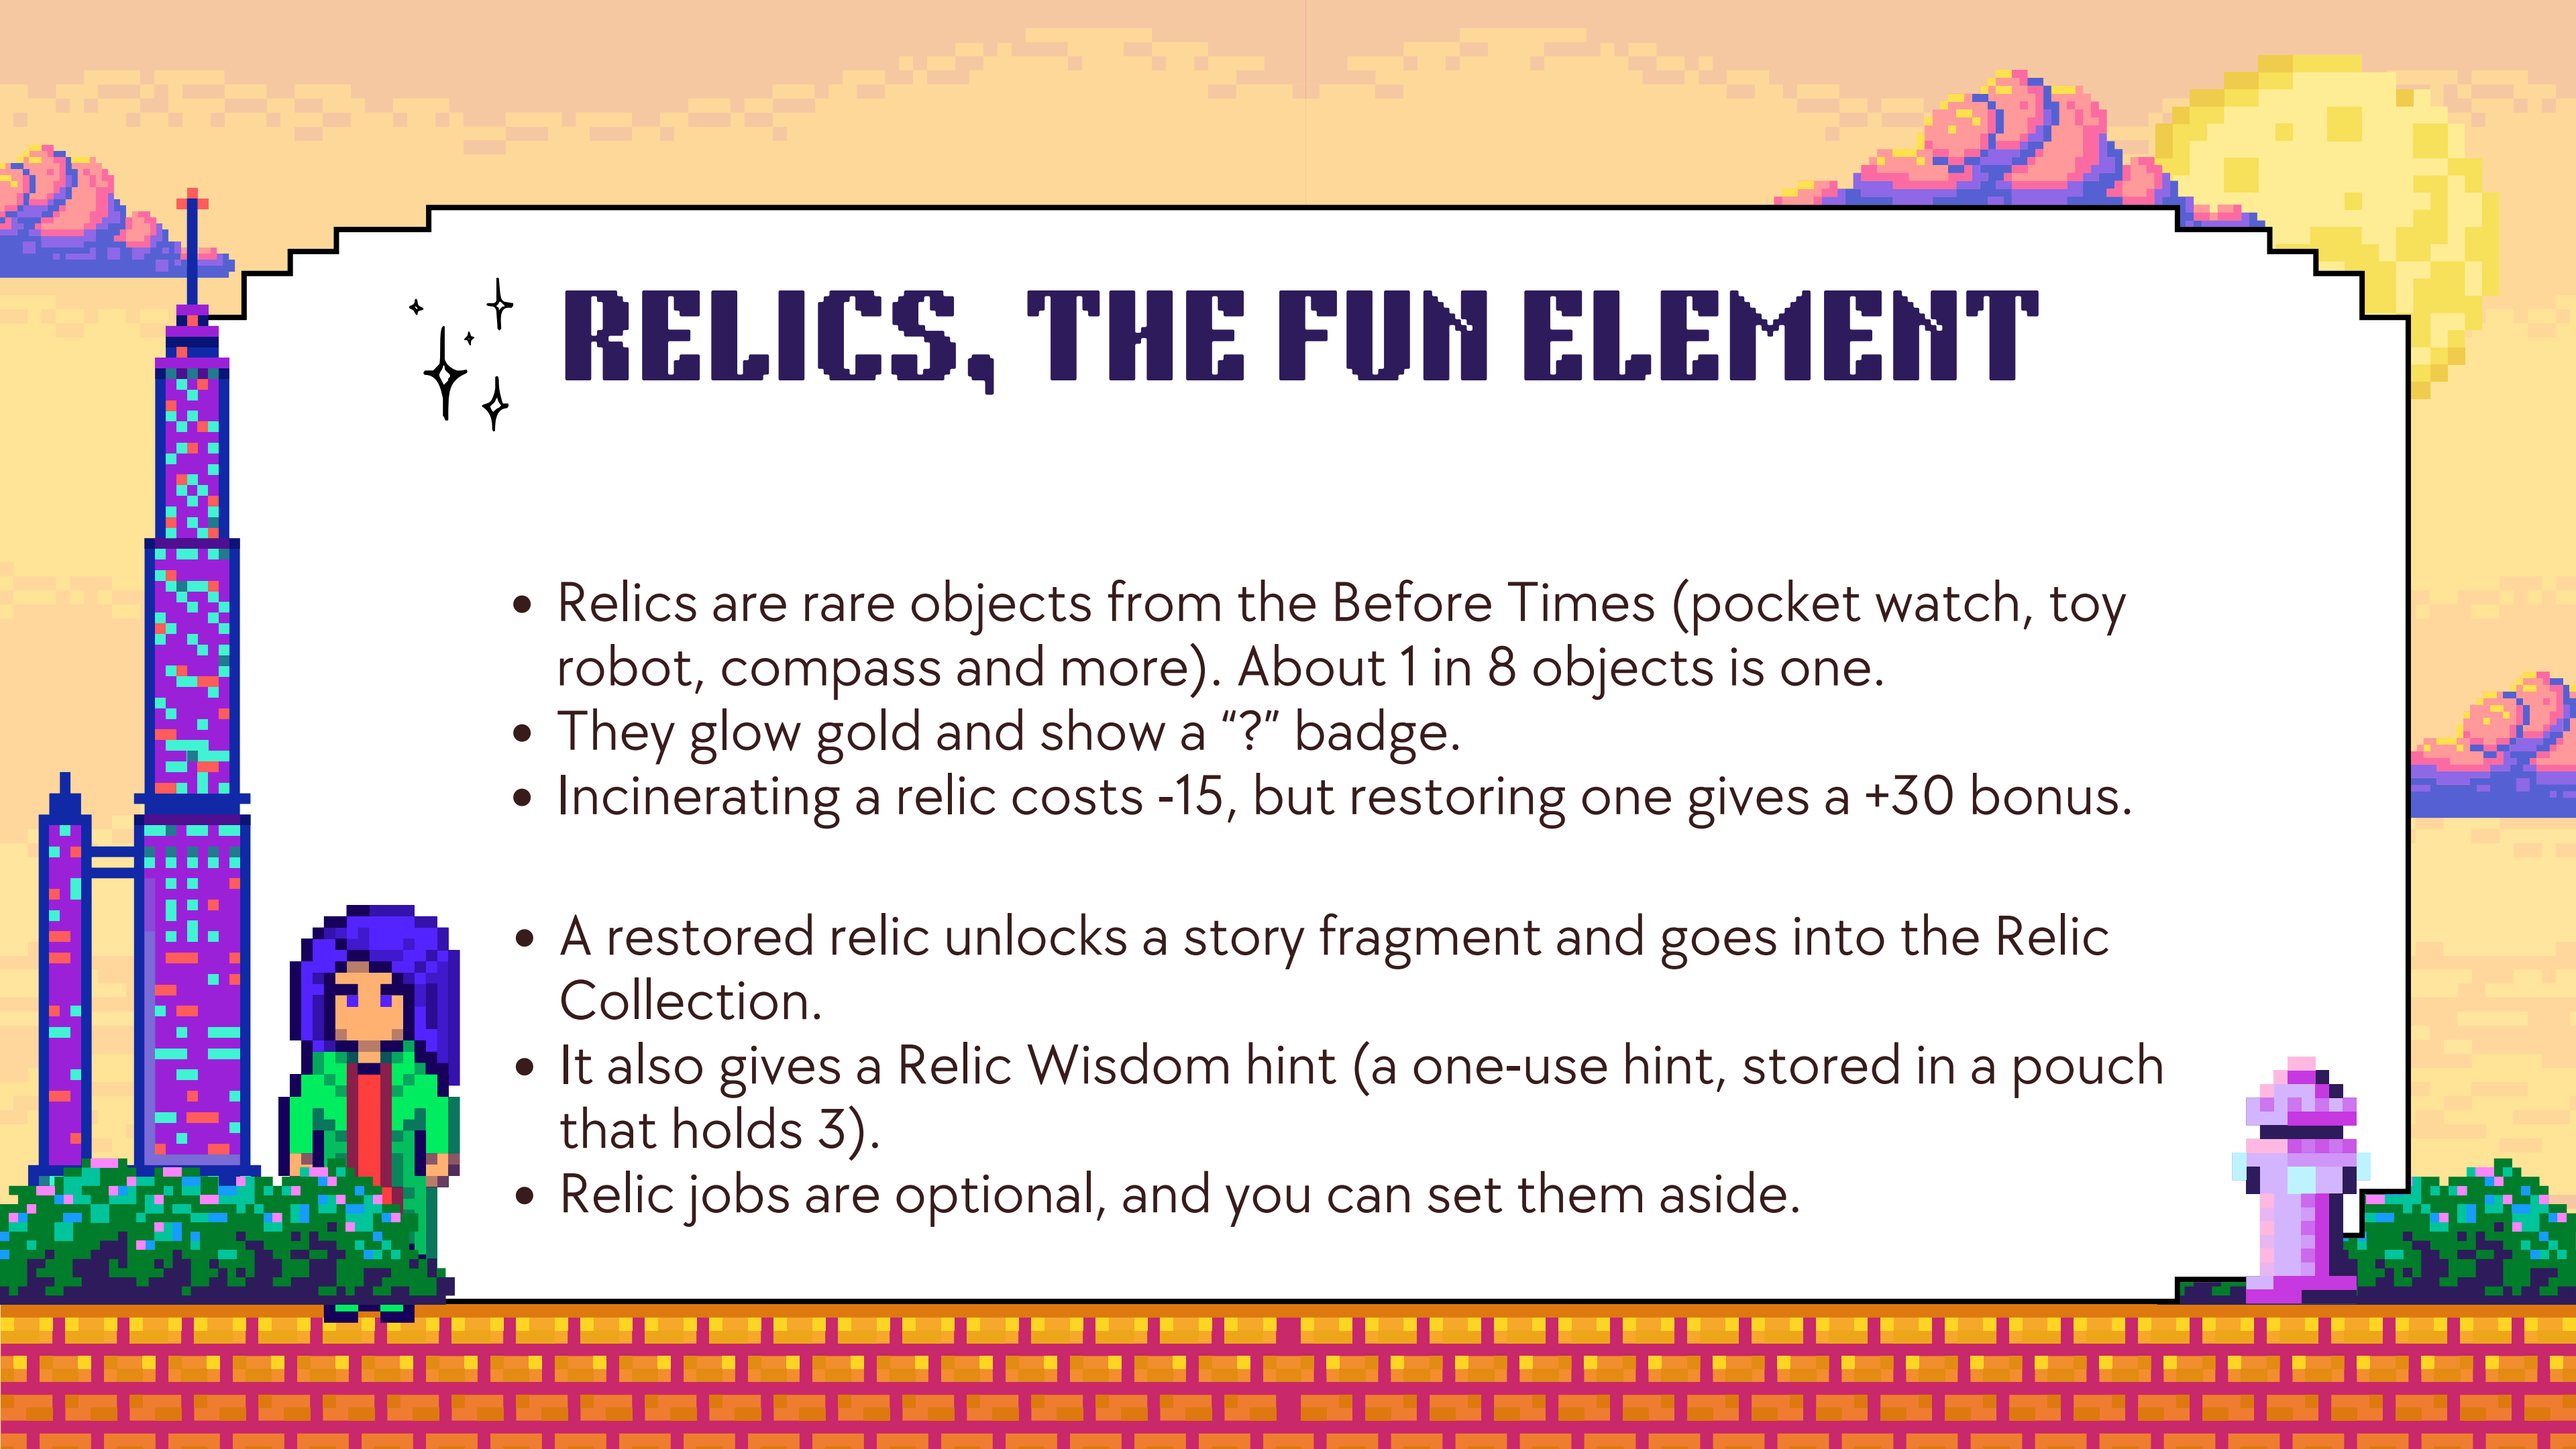

- Main menu with a live score and level display
- 20 ordinary objects and 8 relics, each with inspection clues
- Feedback after every decision that explains why
- Parts storage shared between levels
- 13 repair jobs with Martha's instructions
- Replacement parts taken from your Level 2 storage
- Progress bar, completion screens and a drop-back screen
- Mouse and keyboard controls
- The whole game flows from the menu through Level 3

RELICS, THE FUN ELEMENT

- Relics are rare objects from the Before Times (pocket watch, toy robot, compass and more). About 1 in 8 objects is one.
- They glow gold and show a “?” badge.
- Incinerating a relic costs -15, but restoring one gives a +30 bonus.

- A restored relic unlocks a story fragment and goes into the Relic Collection.
- It also gives a Relic Wisdom hint (a one-use hint, stored in a pouch that holds 3).
- Relic jobs are optional, and you can set them aside.

SOCIAL GOOD INTEGRATION (SDG 12)

Issue: Resource waste.
Usable products and parts are discarded too easily.

Goal: SDG 12, Responsible Consumption and Production.

Cycle: Sort → Recover → Repair → Reuse

In the gameplay now:

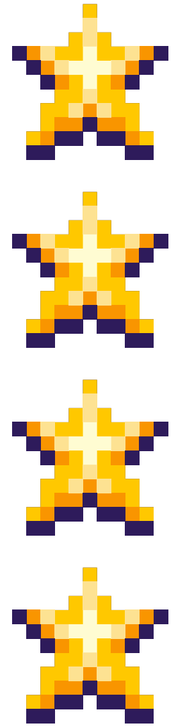

- Throwing away something repairable costs you points.
- Recovered parts become real replacement parts in Level 3.
- Relics show that some objects are worth keeping for what they mean.

Message: A broken object is not automatically waste.

NOT YET IMPLEMENTED

- Levels 4–5: Guided to independent repairs
- Relic Wisdom: Earnable hints
- Relic Collection: Saved discoveries
- Silo Inspector: Special event
- Pixel Art: 28 unique objects
- Sound & Animations
- Bonus Mechanics: Timers and streaks
- Martha's Personality: More dialogue and character
- Player Testing: Validate the game's message

PLANS FOR PROTOTYPE II

- **Level 4** — Guided Repair: Score repairs based on the percentage of correct steps, with Martha offering only general advice.
- **Level 5** — Independent Repair: Repair without Martha's help, relying on recovered parts and relic hints.
- **Relic Hint Effects**: Give relics unique abilities, such as a pocket watch revealing step order or a camera exposing defects.
- **Relic Collection**: Add a screen to view collected relics and their discoveries.

AI USAGE

Claude

- **Claude (Anthropic):** Brainstorming, README writing, code development and refactoring, and game content.

- **Google Gemini:** Generated pixel-art images.

- **My Contribution:** Wrote parts of the code, reviewed and tested AI-assisted code, removed redundancy, and made the final design, story, and gameplay decisions.

THANK YOU

Individual project. Concept, design, README, programming, content and testing by Deepthi Nenavath
